

# Teaching physics in XXI century. Why and How

Prof. Łukasz A. Turski

The force of the civilization change which is taking place over the last fifty years or so, has bright and dark sides. Unfortunately the educational systems opted for the dark side of that force. That also refers to teaching physics in spite of the incorporation in physics education almost all of the IT gadgets available today. In this talk I will discuss current physics education as I see it and outline my view on what we can do not only in order to teach people physics, but also to proliferate rational thinking in our societies. Rational thinking without which our future might look pretty bleak.
